

Firwin FAQ - Proper Care of Removable Insulation Blankets

Here are six easy tips to help you ensure the proper performance and longevity of your insulation blankets:

1. The fastening system is more than suitable to hold the blankets in place. Care must be taken not to use brute strength when installing blankets.
2. For the best service, blankets should be kept clean.
3. Any chemicals which will cause deterioration of the aluminum or silicone coatings should be removed and cleaned off.
4. Should the blanket or insulation matt become saturated with oil, their natural "non-combustible" characteristics will no longer be effective and the blanket should be replaced.
5. Like all engine parts, blankets should be regularly inspected.
6. Care must be taken not to cut or damage the outer protective cover fabrics with sharp instruments.
